SKYLINE ENHANCEMENT MODULE

AUTOMATIC PAYROLL DATA CONVERSION

If you use a payroll service like ADP, Paycheck or any other, and have more than a few employees, you know what it's like to manually make the necessary Journal Entries. Every month get the data from your payroll service, bring up SKYLINE, go to the Journal Entry Screen and click, click, click.

If you can get a file from your payroll service (and most can do it, if you ask) Payroll Data Conversion can convert that file to an OTGLTRAN file which can automatically be read into SKYLINE.

Payroll Data Conversion checks the data for accuracy and formatting and then produces a file that SKYLINE quickly and accurately processes, writing the correct Journal Entries.

If you use a payroll service then you probably have enough employees to save time with the Payroll Data Conversion Enhancement Module. And, think of the improved accuracy! No mis-typed or mis-applied Journal Entries. Perfect Journal Entries every time!

Payroll Data Conversion provides you the perfect solution to automate an important function to make you and other SKYLINE users more productive. It's the perfect tool to easily and accurately process all of your payroll related Journal Entries. And, what's more important than accurate financial posting and reporting?

Based on the file you can receive there is normally a small amount of customization to ensure the Payroll Data Conversion program correctly reads the file for proper use in SKYLINE.
